9. The Choice

About This Series · Sources

## In Brief

- AI is not a tool that performs tasks. It is the new medium through which people learn, think, and create, and a medium of thought cannot be rationed the way a tool can without deciding who is allowed to think.
- The frontier has crossed a line this year: its most capable models are built to operate a computer on their own rather than to advise, and their makers are now placing them in humanoid bodies. The tool that helped a worker has become a worker.
- The technology's nature is to complement human work far more than to replace it. Whether it augments or displaces is a choice, decided by who owns it and how widely it is shared, not by the machine.
- Creation and displacement are not equal and opposite. Creation compounds upward without a ceiling. Displacement compounds downward without a floor, because a capability a company, an industry, or a nation loses is one it cannot easily win back. The gap widens on both ends at once.
- The way out is a choice a nation makes deliberately: to treat intelligence as national infrastructure, own it, and put it in the hands of all its people, turning a technology of displacement into an engine of creation.

# Executive Summary

The debate over artificial intelligence and work is framed as a forecast, a guess at how many jobs the technology will take. That framing is already out of date. The frontier has stopped building tools that help people work and started building machines that do the work, and it is now giving them physical form. The question is no longer whether AI will displace workers. It is whether a nation will let the same technology hollow out its workforce, or use it to expand what its people can do. Which one happens is being decided now, by who owns the intelligence and who is allowed to use it.

**The tool that assisted a worker has become a worker. The question is no longer what AI can do for a nation's people, but what it will do instead of them, and who owns it.**

# 1. What AI Actually Is

Every argument about AI and work begins in the wrong place, with the question of which tasks a machine can perform. That question treats AI as a tool, a faster way to do work that already exists. It is the natural way to think about a new technology, and for most technologies it is correct. It is the wrong way to think about this one.

Artificial intelligence is better understood as a medium than as a tool. It is becoming the means through which a person learns a subject, works through a problem, drafts an idea, and tests it. In that role it belongs to a small and consequential category: the mediums of thought. Writing was one. The printing press extended it.

The internet was the most recent. None of them merely helped people do existing tasks faster. Each changed what it was possible to learn, think, and create, and each reorganized the societies that adopted it around the new possibility.

A society treats a medium of thought differently from a tool. A tool can be rationed to those who need it with little consequence, since not everyone requires a lathe. A medium of thought cannot. Nations understood this about reading centuries ago, which is why they made literacy universal rather than a privilege of the few. AI puts the same question back on the table, and most of the world is answering it by accident.

**You do not ration a medium of thought the way you ration a tool. Rationing thought decides who is permitted to think.**

# 2. The Machine That Now Acts

For most of its short history, artificial intelligence advised. It answered questions, drafted text, suggested code, and left the doing to a person. That has changed, and the change is why this argument is urgent now rather than someday.

This year the most capable models at the frontier were built not to advise but to act. Their makers describe them as able to do anything a person can do with a computer, on their own: operating the software, filling in the spreadsheets, building the websites, carrying a task from instruction to finished result with no human in the loop. One crossed the threshold at which a model can find and exploit flaws in live systems without human guidance. The tool that helped a worker has become a worker.

The frontier is not stopping at the screen. The same laboratories have confirmed they will place these models in humanoid bodies, extending an acting intelligence from knowledge work into physical work, and the market is already moving: global shipments of humanoid robots rose 272 percent in the first half of this year alone. An intelligence that can do the knowledge work, in a body that can do the physical work, built and owned by a handful of laboratories. That is not a tool a nation adopts. It is a workforce a nation rents.

**A workforce a nation rents is one it can be charged more for, throttled on, or cut off from, by a decision made somewhere else.**

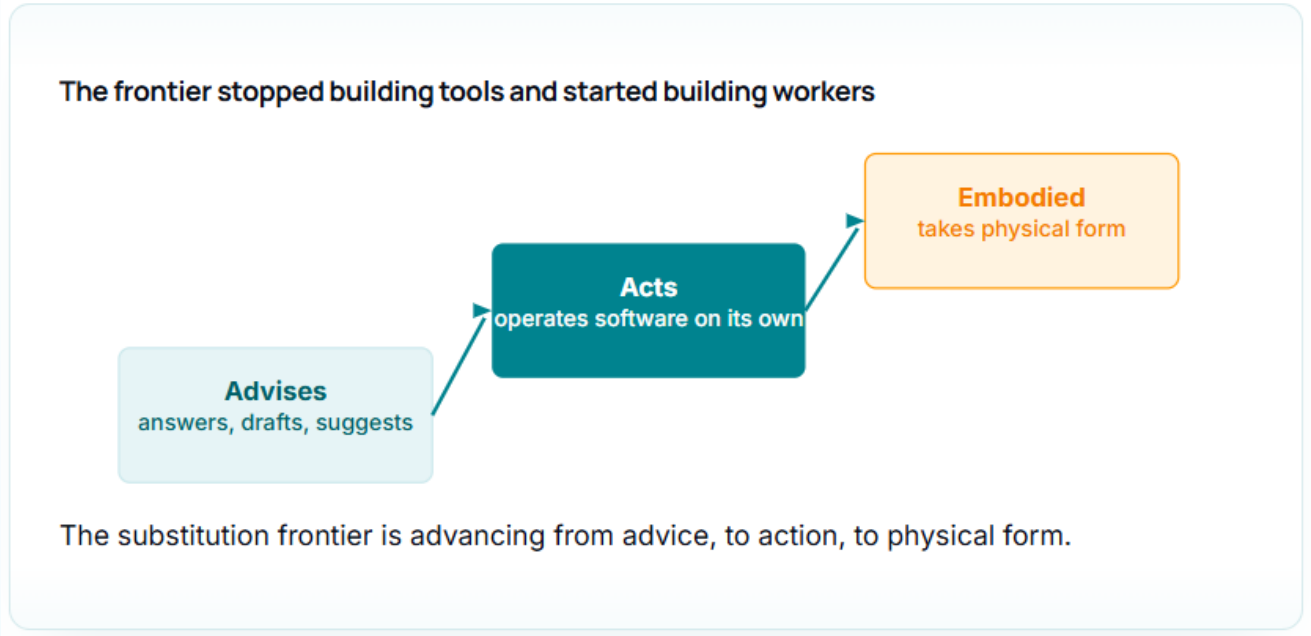

*Figure 2. The substitution frontier advances from advice, to action, to physical form.*

# 3. A Medium of Thought, Rationed

This acting intelligence is arriving rationed, and the rationing is easy to miss because it looks like ordinary commerce. The mechanism is price. When intelligence is rented and billed by the unit of use, access flows to the users whose output justifies the meter and is withheld from everyone else. Inside any economy the result is a small tier of empowered creators and a large majority of onlookers. It is rationing by budget rather than by talent.

**The technology's nature is to make people more capable. Only the model we rent it under makes it replace them.**

What makes this a genuine loss, rather than a fair allocation of a scarce good, is that the technology's own nature runs the other way. The International Labour Organization's global assessment finds that the large majority of jobs exposed to generative AI are exposed to augmentation, where the technology assists a person, rather than to full automation, where it replaces one. Left to itself, AI tends to complement human work. It is the model we deploy it under, rented and rationed and pointed at cost, that turns a complement into a substitute.

The figure carries two messages. The augmentation potential is real, and it is the dominant mode of AI at work. And it is unevenly available, skewing toward the wealthy economies with the access to capture it. The upside exists, and it is being handed to the few.

**The technology's nature is to make people more capable. Only the model we rent it under makes it replace them.**

## 4. Why Creation Compounds

The economics decide how far creation spreads. Because an owned capability costs the same whether a few use it or the whole workforce does, while a rented one charges for every additional user and rises each year, the same budget puts more people in a position to create every year than the metered alternative would allow. Creation compounds not only because ideas multiply, but because the cost structure keeps widening the circle of those permitted to have them. And as each person learns to direct a team of agents, the creator becomes a composer, arranging many hands into one outcome, so what each can make grows even as the number who can make grows.

To see how costly the default really is, it helps to understand how creation actually happens, because this is the step the displacement debate skips entirely. When a tool is shared, its use divides. Two people with one lathe each get less. When a medium of thought is shared, its use multiplies, because the raw material of creation is ideas, and ideas are not used up when they are shared. They circulate, they combine, and each combination becomes a new starting point.

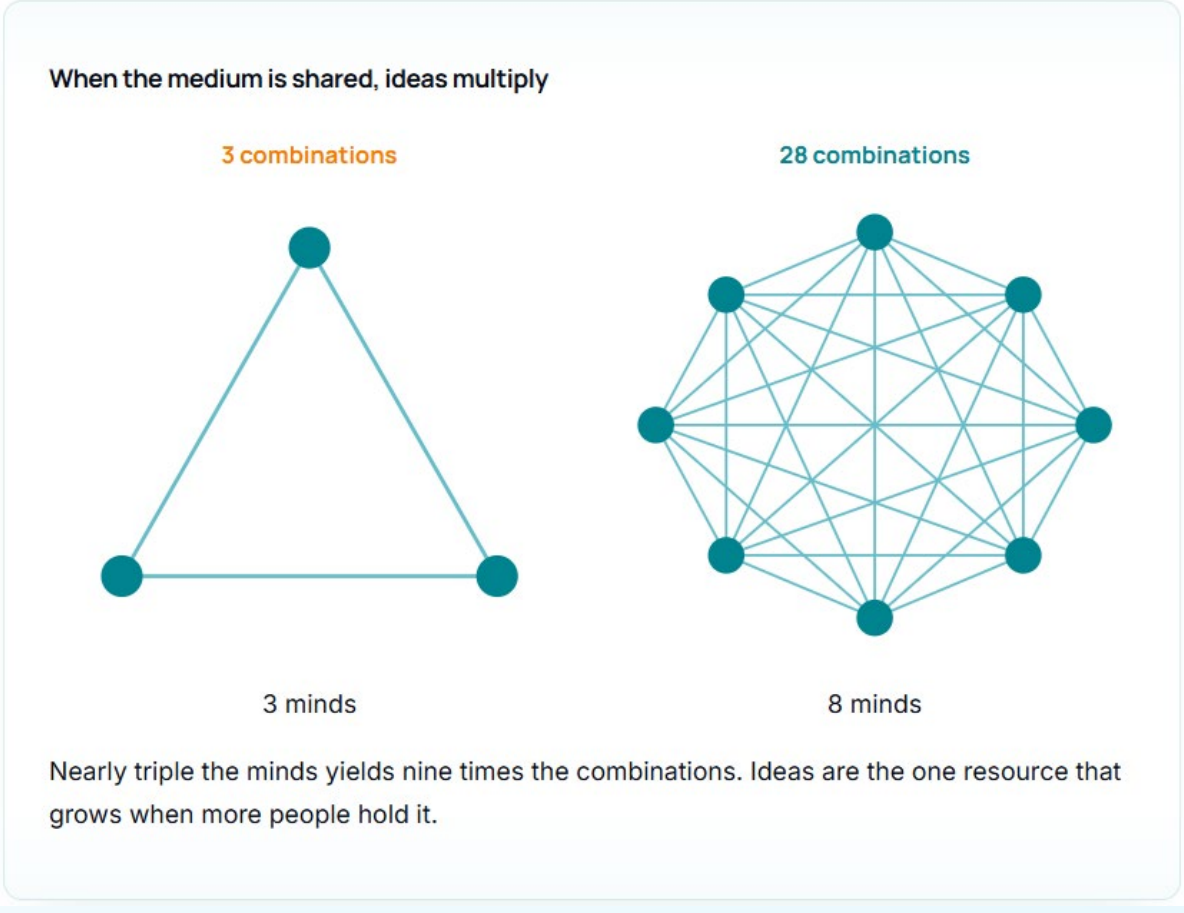

*Figure 3. Jobs that could gain from AI augmentation, by country income. Source: International Labour Organization, 2023.*

Put the medium in the hands of ten thousand people and you do not get ten thousand ideas. You get the ideas, and the combinations between them, and the combinations are where most of the value lives. Literacy did not simply produce more readers. It produced a scientific revolution, because it let ideas find one another at a scale that had never been possible. There is a second multiplier, and it is speed. A society in which everyone can work with the medium generates more ideas, tests them faster, discards the failures sooner, and compounds the survivors. The velocity of learning and ideation becomes a national capability in its own right.

**Shared, a tool divides. A medium of thought multiplies, because ideas are the one resource that grows when more people hold it.**

## 5. Why the Two Are Not Symmetric

Now the central point, and it is the one the phrase "AI creates or displaces" hides. Creation and displacement are not equal and opposite. They are two compounding forces running in opposite directions.

Creation compounds upward. Each idea becomes raw material for the next, and there is no ceiling. Displacement compounds downward, and this is the part the debate gets wrong when it treats displacement as a one-time cost. When a company loses a capability, an industry loses its base, or a workforce loses its footing, the loss does not sit still. The skills

atrophy. The firms that would have trained the next generation are gone. The nation that fell behind keeps falling, because the capability it lost is the capability it would have needed to catch up, and because the nations still creating are pulling further ahead every year. Displacement is not a floor a nation lands on. It is a slope it slides down, and the slide accelerates.

This is the true asymmetry, and it is far sharper than a bounded loss set against an unbounded gain. It is two unbounded processes, one lifting a nation and one sinking it, with the distance between the two futures widening on both ends at once. A capability a nation keeps compounds into more. A capability a nation loses compounds into less. There is no symmetry to appeal to and no equilibrium to wait for.

**Creation compounds upward without a ceiling. Displacement compounds downward without a floor, and what a nation loses, it does not get back.**

## 6. This Will Worsen If Nothing Changes

The danger of the default path is not that it holds steady. It is that it slides, and the slide accelerates. Because both forces compound, the gap between a society that creates with the medium and one that only consumes it does not stay constant. It widens every year, and the widening feeds itself, since the society that ideates faster pulls ahead, which lets it ideate faster still, while the society that fell behind loses the very capability it would need to close the distance. The world's own institutions are warning about precisely this concentration of capability, expertise, and investment in a small number of hands.

> **"The digital divide must not be allowed to harden into an AI divide."**
>
> **António Guterres, Secretary-General, United Nations · 2026.**

And some of what is lost cannot be bought back later. A tool deferred can be purchased next year at the same price. A generation that grows up without the medium of thought cannot be handed back the years in which it did not learn to use it. A workforce that has already ceded its footing does not simply resume where it stood. The cost of waiting is not paid later at face value. It compounds, like everything else in this story, against the nation that waits.

# 7. The Ways Out

There is more than one response, and they are not equal. It is worth being honest about both.

The first path is humane and worth doing, and it will help real people. But it accepts that the medium of thought is owned and priced elsewhere and tries to buy back a little access at the margins. It slows the slide; it does not turn it around. The second path changes the underlying position: only ownership makes broad access affordable at national scale, because only ownership removes the meter that does the rationing.

The economists who study technology and prosperity most closely reach the same conclusion by a different route: the direction a technology takes is a choice, not a fate. The first path manages displacement. The second produces creation. They are not two versions of one strategy. They are the two different futures, and a nation gets to choose between them.

> **"To support shared prosperity, AI must complement workers."**
>
> **Daron Acemoglu and Simon Johnson, MIT · in IMF Finance & Development, 2023**

| Manage the damage | Change what the nation owns |
|---|---|
| **Subsidize access for some, regulate rental terms, fund reskilling and safety nets** | Treat intelligence as national infrastructure, own it, and extend it to all |
| **Treats the symptom; the medium stays owned and priced elsewhere** | Treats the cause; access becomes a policy decision made at home |
| **The compounding still happens, but it happens abroad** | The compounding happens at home and accrues to the nation |
| **Slows the descent** | Reverses its direction |

# 8. What Leaders Must Do

The choice becomes real through a small number of decisions, and they belong to the most senior leaders in a nation rather than to its technologists.

- **Treat access as a right, not a purchase.** Establish that the ability to learn and create with AI reaches the whole population, the way universal literacy was once established.
- **Own the medium.** Ensure the intelligence the nation depends on is owned and governed by the nation and grounded in its own knowledge, so access is decided at home rather than priced abroad.
- **Point it at capability, not only cost.** Direct national AI toward extending what people can do, rather than only toward replacing what they already do.
- **Build for velocity.** Put the medium in as many hands as possible, because the rate at which a society generates and tests ideas is now a national capability, and it compounds.
- **Act before the descent compounds.** Move while capability can still be built rather than rebuilt, because a slide left to accelerate is far more expensive to reverse than to prevent.

**A nation that treats intelligence as a cost to minimize gets a smaller version of what it already has. One that treats it as a capability to spread gets something it has never had before.**

# 9. The Choice

Displacement is what a nation gets when it makes no choice at all, when it lets the medium of thought be owned elsewhere, priced by a meter, and rationed to the few who can pay. That is the default, and the default is not neutral. It points a machine now built to act at substitution, it concentrates the gains, and it slides, year over year, toward a smaller and more dependent workforce that cannot easily recover the ground it has lost.

Creation is what a nation gets when it chooses deliberately, when it treats intelligence as the medium of learning and ideation it has become, owns it, and puts it in the hands of all its people. That choice does not merely avoid the feared outcome. It starts a compounding engine of national capability that runs for as long as the nation keeps learning, and it keeps the returns at home. The two futures begin from the same technology and the same moment. What separates them is not the machine. It is the decision, and because everything in this story compounds, the decision is worth more today than it will ever be worth again.

**Displacement is the future a nation gets by default. Creation is the one it chooses.**

# About This Series

Sovereign Perspectives is a research program on the ownership and governance of intelligence, published by Concierto. Its papers examine the strategic, economic, and institutional questions that artificial intelligence raises for governments and other accountable institutions, and they are written for the leaders making those decisions. The program's aim is to advance the public argument, not to promote a product.
