About This Series · Sources

In Brief

- Most of the world's languages are barely present in the data that trains AI, so a general model serves a few languages well and the rest poorly.
- A model carries the language, assumptions, and values of the society whose data built it, and it passes them to everyone who adopts it.
- Adopting such a model molds a people to its defaults; it asks them to think in another society's categories to be understood.
- A model grounded in a people's own language and values mirrors them instead, reflecting their world rather than overwriting it.
- Only an intelligence a people owns can be grounded this way, which makes cultural and linguistic fit a question of sovereignty.

Executive Summary

An intelligence trained on the world's dominant languages does not simply fail to understand the rest. It quietly asks them to become someone else in order to be understood.

Of roughly 7,000 languages spoken on earth, only about 400 are fully accessible online, and most model training data is a single language. The result is an intelligence that serves the few languages of the internet well and underperforms for the 1.2 billion people who speak the rest. This essay argues that a general model shaped by another society's language and assumptions molds the people who adopt it, and that only an intelligence a people owns and grounds in their own language and values can mirror them instead.

> **A borrowed intelligence does not just answer in another language. It asks a people to become someone else to be understood.**

1. The Languages AI Leaves Out

Begin with the data, because everything follows from it. There are roughly 7,000 living languages, and only about 400 are fully accessible online; a single language accounts for around half of all web content though fewer than one in five people speak it, and most model training data is overwhelmingly in that one language.

A model learns the world from this record, so it learns most of humanity's languages faintly or not at all, and it underperforms for the 1.2 billion people whose languages are barely present. This is not a temporary gap that scale will close on its own, because the imbalance is in the foundation the models are built on.

A model learns the world from what has been written down, and most of the world has not been written down for it.

2. A Model Carries a Worldview

Language is not a neutral surface. It carries the categories a society thinks in, the assumptions it takes for granted, and the values it rarely states aloud. A model trained on one society's language absorbs that society's worldview along with its words, and it carries them into every context that adopts it. This is easy to miss for those who already speak the dominant language, because the model simply feels natural to them. For everyone else, the model's fluency comes with a quiet demand: to be understood well, phrase the world the way the model expects.

Every language is a way of seeing. A model fluent in only a few is fluent in only a few ways of seeing the world.

3. Mold Versus Mirror

Here is the distinction the title turns on. A general model built elsewhere molds. It reflects the world of its training data, and to the degree a people differs from that world, adopting the model nudges them toward it, in the examples it offers, the norms it assumes, the answers it treats as obvious. Over years and at scale, a nation that runs its public life on such a model runs it in another society's categories, and its own recede. A model grounded in a people's own language, knowledge, and values does the opposite. It mirrors them. It reflects their world back to them, reinforcing rather than eroding what makes them distinct.

The difference is not cosmetic. A medium of thought that molds a people over a generation changes how they reason and what they take for granted; a medium that mirrors them extends what they already are. Which of the two a people gets is decided by whose language and values the intelligence is grounded in, and that is decided by who owns it.

A borrowed intelligence molds a people to its defaults. An owned one mirrors them back to themselves.

4. Why the Mirror Must Be Owned

The argument extends from people to agents. An agent grounded in an owned model that mirrors the enterprise acts in the organisation own context, its language, its data, its way of working; an agent running on a rented model imported from elsewhere carries that model defaults into every action it takes autonomously. As more of the work is done by agents rather than by people typing prompts, the question of whose worldview the model carries stops being about the answers a person reads and becomes about the actions a fleet of agents takes on the organisation behalf. A mirror matters more, not less, once the intelligence begins to act.

A model can only mirror a people if it is grounded in their language, their texts, their history, and their judgments, and that grounding requires control the renter of a general model does not have. To ground a model in a nation's knowledge is to build the model on that knowledge, which means owning it. This is why cultural and linguistic fit is not a feature to request from a supplier but a consequence of sovereignty: a people that owns its intelligence can teach it to mirror them; a people that rents one receives whatever worldview it was built with.

A rented general model	An owned, grounded model
Fluent in a few dominant languages	Fluent in the people's own language
Carries another society's assumptions	Carries the people's own
Molds users toward its defaults	Mirrors users' own world
Cannot be grounded without ceding data	Grounded in the people's knowledge, held at home

> **Cultural fit cannot be requested from a supplier. It is grown in a model a people owns.**

5. What Leaders Must Do

- **Treat language as national infrastructure.** Fund the digitization and curation of the nation's own language and knowledge, the raw material a mirroring model requires.
- **Ground intelligence in the nation's own record.** Build national AI on national texts, so it reflects the people rather than overwriting them.
- **Own the model that mediates public life.** Keep the intelligence that touches education, media, and administration under national ownership and values.
- **Measure fit in the people's own terms.** Judge the model by how well it serves the nation's language and context, not by a benchmark in another.

> **A people that owns its intelligence keeps its own voice. A people that rents one learns to speak in someone else's.**

6. The Choice

The most powerful medium of thought ever built is fluent in a small fraction of the ways human beings actually think, and it is spreading everywhere. Left as it is, it will serve the languages of its training data and quietly ask the rest of humanity to adopt those categories in order to be understood. That is molding, and it is not inevitable. A people that grounds its intelligence in its own language and values, and owns the model that does so, gets a mirror instead: an intelligence that reflects who they are rather than reshaping them into who its data assumed. The choice between the two is a choice about ownership, and it is a choice about identity.

The question is whether a people's intelligence will reflect them, or reshape them. Only the one they own can reflect them.

About This Series

Sovereign Perspectives is a research program on the ownership and governance of intelligence, published by Concierto. Its papers examine the strategic, economic, and institutional questions that artificial intelligence raises for governments and other accountable institutions, and they are written for the leaders making those decisions. The program's aim is to advance the public argument, not to promote a product.
